(54) Title: A CAPPING UNIT FOR CLOSING CONTAINERS WITH RESPECTIVE CAPS

(57) Abstract: Containers (2) are closed with screw caps (3) by a unit (1) of the type comprising a carousel (7) on which to advance the containers (2) and the relative caps (3), driven by a motor (6) about a respective primary axis (5a) and equipped with a plurality of capping assemblies (11) each positioned above a relative container (2) and capable of movement vertically between a first position, distanced from the container (2), and a second position of active engagement with the container (2). Each capping assembly (11) presents a gripping mechanism (17) positionable so as to engage a relative cap (3) when the assembly (11) is in the second position, and rotatable about a respective secondary axis (17a) in such a way as to screw the cap (3) onto a threaded neck (4) of the relative container (2). The unit (1) further comprises first motors (14) by which the capping assemblies (11) can be raised and lowered one independently of another, and second motors (18) by which the gripping mechanisms (17) can be rotated one independently of another.
